BMW DCT upgraded oil pan

- Lower Oil temperature
- Increased Oil Capacity
- Direct replacement of OEM pan

The normal DCT oil temp for the BMW is approximately 100-110 degree Celsius.

Our design introduces a larger surface area which lowers temperatures on average by 8-15 degrees.

The new oil pan increases oil capacity by 0.5ltr which also helps to reduce temperature.

With cooler oil temperature the DCT system is better able to maintain transmission cooling during fast road and track day use.
